

## Earthquakes

---

---

---

---

---

---

---

---

## Earthquakes: Big Ideas

- Humans cannot eliminate natural hazards but can engage in activities that reduce their impacts by identifying high-risk locations, improving construction methods, and developing warning systems
- Water's unique physical and chemical properties are essential to the dynamics of all of Earth's systems
- Understanding geologic processes active in the modern world is crucial to interpreting Earth's past
- Over Earth's vast history, catastrophic processes have produced enormous changes
- Earth scientists do reproducible experiments and collect multiple lines of evidence.

---

---

---

---

---

---

---

---

## Earthquakes

- earthquake: movement of rock bodies past other
- fault: locus of the earthquake movement
- faults come at all scales, mm to separation of lithospheric plates (e.g., San Andreas).

---

---

---

---

---

---

---

---

## Elastic Rebound

- Stress builds up in rocks until it exceeds the strength of rock
- Elastic deformation is expressed in rocks between earthquakes

**ROCKS DEFORM ELASTICALLY, THEN REBOUND DURING AN EARTHQUAKE RUPTURE.**

**TIME 1**  
A farmer builds a stone wall across a right lateral strike slip fault a few years after its last rupture.

**TIME 2**  
Over the next 150 years, the relative motion between blocks on either side of the locked fault causes the ground and the stone wall to deform.

**TIME 3**  
Just before the next rupture, a new force is built across the already-deformed fault.

When the stress exceeds the strength of the fault, a rupture begins at the first point of failure—the focus—beneath the epicenter on the surface. The rupture expands rapidly across the fault.

**TIME 4**  
The rupture displaces the fault, lowering the blocks and the elastic rebound restores the blocks to their pre-entitled state. Both the crack walls and the fence are shifted equal amounts across the fault trace. The rebound straightens the rock wall, but the fence exhibits a reverse curve.

## Stress versus Time

**0 Second**  
Rupture expands circularly on fault plane, sending out seismic waves in all directions.

**5 Seconds**  
Rupture continues to expand as a crack along the fault plane. When rupture front reaches the surface, displacements occur along the fault trace and rocks at the surface begin to rebound from their deformed state.

**10 Seconds**  
Rupture front progresses down the fault plane, reducing the stress and allowing rocks on either side to rebound. Seismic waves continue to be emitted in all directions as the fault propagates.

**20 Seconds**  
Rupture has progressed along the entire length of the fault. The fault has reached its maximum displacement, and the earthquake stops.

A fence built across the San Andreas fault near Bolinas, California, is offset by nearly 3 m after the great San Francisco earthquake

## Before and After

---

---

---

---

---

---

---

---

## Earthquake terms

focus: site of initial rupture  
epicenter: point on surface above  
the focus

---

---

---

---

---

---

---

---

## Recording Earthquakes: Vertical

Seismograph designed to detect vertical movement

---

---

---

---

---

---

---

---

## Recording Earthquakes: Horizontal

Seismograph designed to detect horizontal movement

---

---

---

---

---

---

---

---

## P, S and Surface Waves

THE THREE DIFFERENT TYPES OF SEISMIC WAVES MOVE AT DIFFERENT SPEEDS

---

---

---

---

---

---

---

---

*P* waves (compressional) 6–8 km/s. Parallel to direction of movement (slinky), also called primary waves. Similar to sound waves.

---

---

---

---

---

---

---

---

S waves (shear) 4–5 km/s. Perpendicular to direction of movement (rope); also called secondary waves. Do not pass through liquids.

**S-wave motion**

Shear-wave crest

---

---

---

---

---

---

---

---

## Surface Waves

- Slowest
- Highest Amplitude
- Decay with depth

**Surface wave motion**

---

---

---

---

---

---

---

---

## Locating an Epicenter

- The difference between the arrival times of the P and S waves at a recording station is a function of the distance from the epicenter.

THE THREE DIFFERENT TYPES OF SEISMIC WAVES MOVE AT DIFFERENT SPEEDS

- But it does not tell you direction
- Therefore, you need at least three stations to determine the location of an epicenter.

---

---

---

---

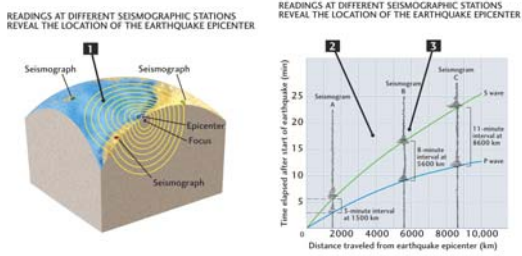

---

---

---

---

## Locating an Epicenter

---

---

---

---

---

---

---

---

---

---

READINGS AT DIFFERENT SEISMOGRAPHIC STATIONS REVEAL THE LOCATION OF THE EARTHQUAKE EPICENTER

---

---

---

---

---

---

---

---

---

---

## Measuring the Force of Earthquakes

### 1. Surface displacement

- 1964 Alaska earthquake displaced some parts of the seafloor by ~ 50 ft.
- 1906 San Francisco earthquake moved the ground ~8.5 ft.

### 2. Size of area displaced

Alaska — 70,000 sq. miles

---

---

---

---

---

---

---

---

---

---

## Measuring the Force of Earthquakes

3. *Duration of shaking*  
Up to tens of seconds
4. *Intensity scales*  
Based on damage and human perception
5. *Magnitude scales*  
based on amount of energy released

---

---

---

---

---

---

---

---

## Richter scale

- Richter scale: amount of energy received 100 km from epicenter
- Largest quake ever recorded = 8.9 (rocks not strong enough for more).
- Earthquakes less than M = 2 are not felt by people.
- Scale is *logarithmic*:
  - Increase 1 unit = 10 times greater shaking
  - Increase 1 unit = 30 times greater energy

---

---

---

---

---

---

---

---

## How Much Energy Released Versus How Often

---

---

---

---

---

---

---

---

## Intensity Scale

Table 19.1 Modified Mercalli Intensity Scale

Intensity Level	Description
I	Not felt except by a very few under especially favorable conditions.
II	Felt only by a few persons at rest, especially on upper floors of buildings. Delicately suspended objects may swing.
III	→ Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibration similar to the passing of a truck.
IV	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI	→ Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.

---

---

---

---

---

---

---

---

## Intensity Scale

Table 19.1 Modified Mercalli Intensity Scale

Intensity Level	Description
VII	→ Damage negligible in buildings of good design and construction; slight to moderate damage in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X	→ Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.
XI	Few, if any (masonry) structures remain standing. Bridges destroyed. Rails bent greatly.
XII	Damage total. Lines of sight and level are distorted. Objects thrown into the air.

---

---

---

---

---

---

---

---

### Intensities Associated With the 1811 Earthquake at New Madrid, Missouri

note a shortcoming of intensity scales: not very many people lived to the west of this EQ so no intensity observations are available.

---

---

---

---

---

---

---

---

## Determining the Type of Earthquake From Seismic Data

Fault motion of different kinds of faults (normal, reverse, shear) will produce distinctive seismic wave characteristics

Atom Bomb is push in all directions

---

---

---

---

---

---

---

---

---

---

---

---

## Distribution of Earthquakes

- not random
- focused around plate margins (but also seen in plate interiors)

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### Damage depends on Construction/Population

**Table 19.2 Recent Earthquakes of Special Interest**

Event	Magnitude	Geologic Effects	Destruction
Loma Prieta, California October 1989	7.1	Maximum intensity in parts of Oakland and San Francisco; landslides; soil liquefaction; small tsunamis at Monterey	60 killed; 3757 injured; U.S. \$7 billion in damage
Landers, California June 1992	7.3	Surface faulting along a 70-km segment with as much as 5.5 m of horizontal displacement and 1.8 m of vertical displacement	1 killed; 400 injured; substantial damage
Northridge, California January 1994	6.9	A maximum uplift of 15 cm occurred in Santa Susana Mountains; many rockslides; ground cracks; soil liquefaction	58 killed; 7000 injured; 20,000 homeless; U.S. \$20 million in damage
Northern Bolivia June 1994	8.2	At 637 km depth, the largest deep earthquake on record; first earthquake from this part of South America to have been felt in North America including Canada	Several people killed
Kobe, Japan January 1995	6.9	Surface faulting for 9 km with horizontal displacement of 1.2 to 1.5 m; soil liquefaction	5502 killed; 36,896 injured; 310,000 homeless; severe damage

---

---

---

---

---

---

---

---

## Earthquake Damage: Ground Motion

- 3 waves hit at different times and with different times of motion
- Highest amplitude comes last when buildings are already damaged

THE THREE DIFFERENT TYPES OF SEISMIC WAVES MOVE AT DIFFERENT SPEEDS

---

---

---

---

---

---

---

---

“Earthquakes don’t kill people,  
buildings kill people.”

---

---

---

---

---

---

---

---

## Earthquake Damage: Fire

Troops patrolling Market Street, San Francisco

---

---

---

---

---

---

---

---

## Earthquake Damage: Landslides

all kinds of mass wasting

liquefaction – sudden loss of strength in water-saturated sediment buildings fall down intact

---

---

---

---

---

---

---

---

## Earthquake Damage: Tsunami

Tsunami generation

---

---

---

---

---

---

---

---

## Earthquake Damage: Tsunami

Indonesia - 1992

---

---

---

---

---

---

---

---

## Earthquake Prediction

- Long term—imprecise (but possible)
- Short term—precise (very difficult)
- We can't stop earthquakes, so we have to be prepared for them

---

---

---

---

---

---

---

---

## Potential Earthquake Hazard, USA

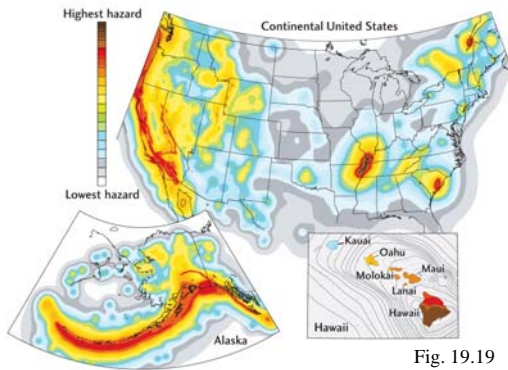

Fig. 19.19

---

---

---

---

---

---

---

---

## Potential Earthquake Hazard, Worldwide

Loss of Life/Property in Haiti primarily due to poor construction

---

---

---

---

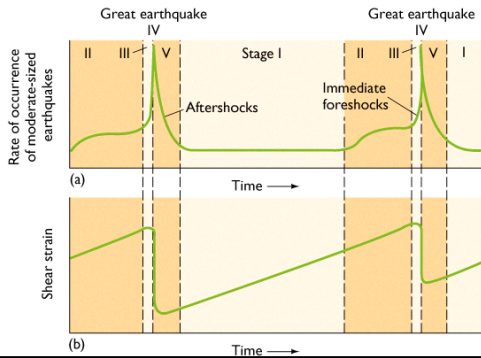

---

---

---

---

Earthquake Prediction: Seismic Gap Method  
 Areas which have not had a recent large earthquake  
 at highest risk because energy is stored in rocks

---

---

---

---

---

---

---

---

## Earthquake Prediction

- Small earthquakes
- Ground tilting
- Change in water levels in wells
- Change in acoustic or electrical properties
- Animal behavior?

---

---

---

---

---

---

---

---

## Be Prepared!

California

Japan

---

---

---
